

**A** F07 Supplementary — Per-module ROC grid: signal decomposition across outcomes

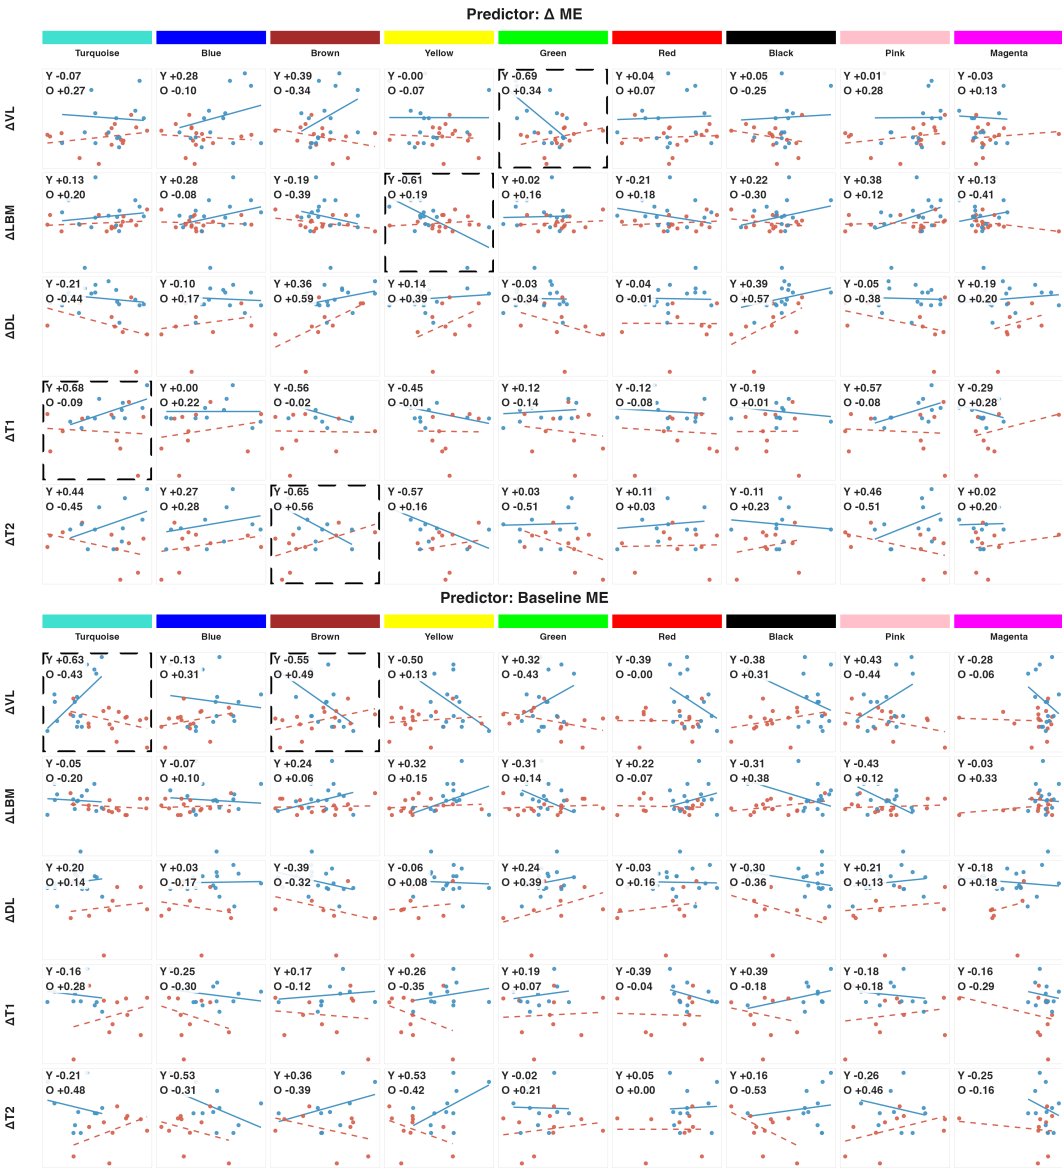

Each cell = univariate AUC from one module eigengene.  
Border: solid black = BH  $q < 0.05$ ; dashed = nominal  $p < 0.05$ ; grey = ns. 1000 permutations (Phiscon-Smyth adjusted); paired within subject for Pre vs Post rows.

Row 1 (Age): Combined ME = (Phi-Prost)2 per subject, ns(0). Row 2 (Delta VL responder): median-odds of age-residualized LVL, predictor = Pre ME. Rows 4-5 (age-specific Pre vs Post): paired within subject; Young  $n = 15$ , Old  $n = 15$  × 2. Row 6 (LBM): median-odds of age-residualized baseline LBM, predictor = Pre ME. Row 7 (Pre vs Post): raw ME values scaled across 30 subjects.

**B** F07 Supplementary — Panel B full sweep: module eigengenes vs  $\Delta$ phenotype, age-stratified

Each cell = per-age Pearson  $r$  (Young solid / Old dashed OLS).  
Border: solid black = BH  $q < 0.05$ ; dashed = nominal  $p < 0.05$  in Young; grey = ns. Screen: 200 tests; 6 raw-avg, 0 BH-avg.

Y/O raw = Pearson  $r$  per subject (Y: O: Data: OLS; F07; age-specific; BH-avg; 6 raw-avg, 0 BH-avg). Screen: 200 tests; 6 raw-avg, 0 BH-avg. Screen: 200 tests; 6 raw-avg, 0 BH-avg.
