

F07 Supplementary — Per-module ROC grid: signal decomposition across outcomes

Each cell = univariate AUC from one module eigengene.

Border: solid black = BH $q < 0.05$; dashed = nominal $p < 0.05$; grey = ns. 1000 permutations (Phipson–Smyth adjusted); paired within subject for Pre vs Post

Row 1 (Age): Combined ME = (Pre+Post)/2 per subject, n=30. Row 2 (Δ VL responder): median-split of age-residualized Δ VL, predictor = Pre ME. Rows 4-5 (age-specific Pre vs Post): paired within subject
