

A F07 Supplementary — Per-module ROC grid: signal decomposition across outcomes

Each cell = univariate AUC from one module eigengene.
Border: solid black = BH $q < 0.05$; dashed = nominal $p < 0.05$; grey = ns. 1000 permutations (Phispon-Smyth adjusted); paired within subject for Pre vs Post rows.

Row 1 (Age): Combined ME = (Phi-Prost)2 per subject, ns(0). Row 2 (Δ VL responder): median-odds of age-residualized Δ VL, predictor = Pre ME. Rows 4-5 (age-specific Pre vs Post): paired within subject; Young $n = 15$, Old $n = 15$ × 2. Row 6 (LBM): median-odds of age-residualized baseline LBM, predictor = Pre ME. Row 7 (Pre vs Post): raw ME values scaled across 30 subjects.

B F07 Supplementary — Panel B full sweep: module eigengenes vs Δ phenotype, age-stratified

Each cell = per-age Pearson r (Young solid / Old dashed OLS).
Border: solid black = BH $q < 0.05$; dashed = nominal $p < 0.05$ in Young; grey = ns. Screen: 200 tests; 6 raw-avg, 0 BH-avg.

Y/O raw = Pearson r per subject (Y: O: Data: ME, F07, signal, baseline, 5 raw, screen, 30 test, 6 raw-avg, 0 BH-avg). Rows 1-2: AVL, ALBM, ADL, AT1, AT2. Rows 3-4: AVL, ALBM, ADL, AT1, AT2. Rows 5-6: AVL, ALBM, ADL, AT1, AT2. Rows 7-8: AVL, ALBM, ADL, AT1, AT2. Rows 9-10: AVL, ALBM, ADL, AT1, AT2.
