

A F07 Supplementary — Per-module ROC grid: signal decomposition across outcomes

Each cell = univariate AUC from one module eigengene.
Border: solid black = BH $q < 0.05$; dashed = nominal $p < 0.05$; grey = ns. 1000 permutations (Phipson–Smyth adjusted); paired within subject for Pre vs Post

Row 1 (Age): Combined ME = (Pre+Post)/2 per subject, n=30. Row 2 (Δ VL responder): median-split of age-residualized Δ VL, predictor = Pre ME. Rows 4-5 (age-specific Pre vs Post): paired w

B F07 Supplementary — Panel B full sweep: module eigengenes vs Δ phenotype, age-stratified

Each cell = per-age Pearson r (Young solid / Old dashed OLS).
Border: solid black = BH $q < 0.05$; dashed = nominal $p < 0.05$ in Young; grey = ns. Screen: 200 tests; 6 raw-sig, 0 BH-sig.

Inline stats = Pearson r per stratum (Y, O). Data: 04_Figures/F07/c_data/panel_B_full_screen_bh.csv. Hero picks in MAIN Panel B (MEgreen $\rightarrow$ Δ VL, METurquoise $\rightarrow$ Δ VL base, MEbrown $\rightarrow$ Δ LBM, METurquoise $\rightarrow$ Δ T1, MEyellow $\rightarrow$
