

Figure 1 displays a 4x3 grid of line graphs illustrating the relationship between the number of children (Y-axis) and the number of children who are also parents (X-axis). The graphs are arranged in a 4x3 grid, with the first column showing the relationship for the first child, the second column for the second child, and the third column for the third child. The Y-axis represents the number of children (0 to 10), and the X-axis represents the number of children who are also parents (0 to 10). The graphs show that the number of children who are also parents is generally lower than the total number of children, and the relationship is often non-linear.

Figure 1: A schematic diagram of the experimental design for the VNC (Ventral Nerve Cord) experiment. The diagram shows four rows of experimental conditions, each with a color-coded bar representing the VNC and a corresponding graph of the VNC's response over time. The rows are: 1) VNC (green), 2) VNC + VNC (blue), 3) VNC + VNC + VNC (red), and 4) VNC + VNC + VNC + VNC (purple). The graphs show the VNC's response over time, with the y-axis labeled 'VNC' and the x-axis labeled 'Time'. The graphs show that the VNC's response is significantly higher in the VNC + VNC + VNC + VNC condition compared to the other conditions.
