

F07 Supplementary — Per-module in-sample ROC grid: signal decomposition across outcomes

Each cell = in-sample (resubstitution) AUC from one module eigengene; held-out LOSO controls in the LOSO panels.

Border: solid black = BH $q < 0.05$; dashed = nominal $p < 0.05$; grey = ns. 1000 permutations (Phipson–Smyth adjusted); paired within subject for Pre vs Post rows (DeLong CI suppressed there).
